/note="Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from 3 pooled germ cell tumors, and was then primed with a Not I oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BBGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library. or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tags for this library are: fetal eyes, AGAATCAAGA; lens, CGATTAGCGA; eye anterior segment, AATGCCGAT; optic nerve, CCATTAAGTG; retina, CCGCG; Retina Foveal and Macular, GTCC; RPE and Choroid, ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI). TAG_TISSUE=human fetal eyes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Conservative

Determination of this BAC-end sequence was carried out as part of collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

/note="Vector: pRKW2; Site_1: BamH1; Site_2: XhoI; 10 ug
of polyA+ RNA was isolated from a mixture of embryos at
stage 10, 20 and 30 and primed by oligo-dT primer:
5'-GACAGACAAGCATCC(T)167N-3' (where V=G,A,C).
5-methyl-dCTP was used instead of dCTP in the first-strand
synthesis in order to get hemimethylated cDNA. After
full-length enrichment, oligo-dG tailing and normalization
against itself, second-strand synthesis was carried out by
priming with 5'-GACAGACACCTCGAGTTAATTAAT(C)13-3' dsDNA
was digested with XhoI/BamHI and directionally cloned into
the pRKW2 vector. Average insert size is 1.5 kb. Library
constructed using the Carninci protocol (Genome Research
2000) by Drs. W. Wu and C. Niehrs (DKFZ, Heidelberg,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 genomic survey sequence.

Two high density colony arrays were made from over intensity clones and hybridized with the probes. Low intensity clones were selected as they represented rare expressed clones. The hybridization intensities for all clones span from 0 to 1.8 million counts and the low abundant class ranged from 0 to 13,000."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5.ATTCTÁGAGGCGÁGGCGGCCGACATG(T)30VN; Directionally cloned, 5 cloning site: Sfi A site GGCCATACGGCCC; linker/adaptor sequence: 5.AAGCAGTGGTATCAACGCAGAGTGGCC; 3', cloning site: Sfi B site GGCCGAGGCGGCC; 3'
